TECHNICAL SERVICE DATA

ATARI®
MODEL 800
COMPUTER

FEATURES: COMPLETE SCHEMATICS • PRELIMINARY SERVICE CHECKS • TROUBLESHOOTING TIPS • EASY-READ WAVEFORMS • REPLACEMENT PARTS LISTS • SEMICONDUCTOR CROSS-REFERENCE

PRELIMINARY SERVICE CHECKS

This data provides the user with a time-saving service tool which is designed for quick isolation and repair of computer malfunctions.

Check all interconnecting cables for good connection and correct hook-up before making service checks.

Disconnect all peripherals except the monitor from the computer to eliminate possible external malfunctions. However, problems involving the interaction between computer and a peripheral will require the connection of the device for voltage and logic readings.

Replacement or repair of the keyboard, main board, RF Modulator, CPU Board, Personality Board, RAM Board, connectors or components may be necessary after the malfunction has been isolated.

GENERAL OPERATING INSTRUCTIONS

POWER UP

The computer will come up ready to program in Basic when a Basic cartridge is plugged in and the computer is turned On.

For instructions on loading and saving programs with an Atari Recorder see the "Cassette Operation" section.

To run a program type RUN and press the RETURN key. To stop a program, press the BREAK key or press the system RESET key.

CASSETTE OPERATION

Connect the Atari Program Recorder to the connector on the right side of the computer. NOTE: A standard tape recorder will not work with this computer.

To load a program, type CLOAD and press the RETURN key. The speaker will beep once. After the speaker beeps, push the play button on the recorder and press the RETURN key again. The program will then load. READY on the screen indicates the loading is completed. The recorder will shut-off automatically.

To save a program, type CSAVE and press the RETURN key. The speaker will beep twice and after the speaker beeps, press the play and record buttons on the recorder and then press the RETURN key. The program will then save. READY on the screen indicates the program has been saved. The recorder will shut-off automatically.

SAMS™**Howard W. Sams & Co., Inc.**

4300 West 62nd Street, P.O. Box 7092, Indianapolis, Indiana 46206 U.S.A.

The listing of any available replacement part herein does not constitute in any case a recommendation, warranty or guaranty by Howard W. Sams & Co., Inc., as to the quality and suitability of such replacement part. The numbers of these parts have been compiled from information furnished to Howard W. Sams & Co., Inc., by the manufacturers of the particular type of replacement part listed.

Reproduction or use, without express permission, of editorial or pictorial content, in any manner, is prohibited. No patent liability is assumed with respect to the use of the information contained herein.

PRELIMINARY SERVICE CHECKS (Continued)

SERVICE CHECKS

SEE INTERCONNECTING DIAGRAM AND PHOTOS TO MATCH THE NUMBER IN THE CIRCLES WITH THOSE IN THE FOLLOWING DATA FOR SERVICE CHECKS TO BE PERFORMED.

① RF MODULATOR

- (A) Apply power to computer and set Power Switch (S202) to On. Verify the Power Indicator LEDs (CR210 and CR211) are lit. If LEDs CR210 and CR211 are not lit, refer to the "Power Supply" section.
- (B) Verify the Channel Select Switch (S203) is set to the same channel as the monitor (Channel 2 or 3).
- (C) Verify that the TV/Computer Switch (Part of Switch box) has been set to the computer position.
- (D) Check for bad connections and improper hookup of the monitor and computer.
- (E) If the computer still does not come On when the power is applied, check the voltages at the RF Modulator connection points. If the voltages are correct, substitute the RF Modulator.

② POWER SUPPLY

- (A) Connect the power pack to 120VAC. Disconnect Connector J206 from computer and check for 10.4VAC at connector. If the voltage is not correct, substitute the power pack.
- (B) Check for 12.5V at the cathode of Diode CR206.
- (C) Check for 5.1V at pin 3 of Voltage Regulator IC (A202).
- (D) Check for 24.4V at pin 1 of Voltage Regulator IC (A201).
- (E) Check for 11.8V at pin 3 of Voltage Regulator IC (A201).
- (F) Check for -5.0V at the anode of Zener Diode CR201.

- (G) If all the voltages check in (B) thru (F) are missing, check Interlock Switch (S201) and Power Switch (S202). If switches are normal, substitute the power board.

③ MAIN BOARD

- (A) Power supply checks out properly, but the computer does not come up when power is applied. Verify the 3.579575MHz Crystal (X101) is oscillating at the proper frequency.
- (B) Crystal X101 is oscillating correctly, but the computer still does not come up. Check the CPU board and the 16K RAM boards by substitution.
- (C) If the computer still does not come up, check the personality board by substitution.
- (D) The computer comes up properly, but the cartridge does not work. Check the personality board by substitution.
- (E) Joysticks or paddles do not function. Check PIA IC (A102) by substitution.
- (F) Computer comes up improperly with power applied. Check Decoder IC (Z101), Buffer ICs (Z105 and Z106) and IC Z102 by substitution.
- (G) No color, vertical or horizontal sync or audio, check the CPU board by substitution.
- (H) Computer will not load or save a program on a cassette. Check Pokey IC (A101) by substitution.

④ KEYBOARD

- (A) One or more keys do not function, substitute the keyboard.
- (B) Several keys do not function. Check the Keyboard Connector (J106) and check Pokey IC (A101) and Decoder ICs (Z103 and Z104) by substitution.

TEST EQUIPMENT AND TOOLS

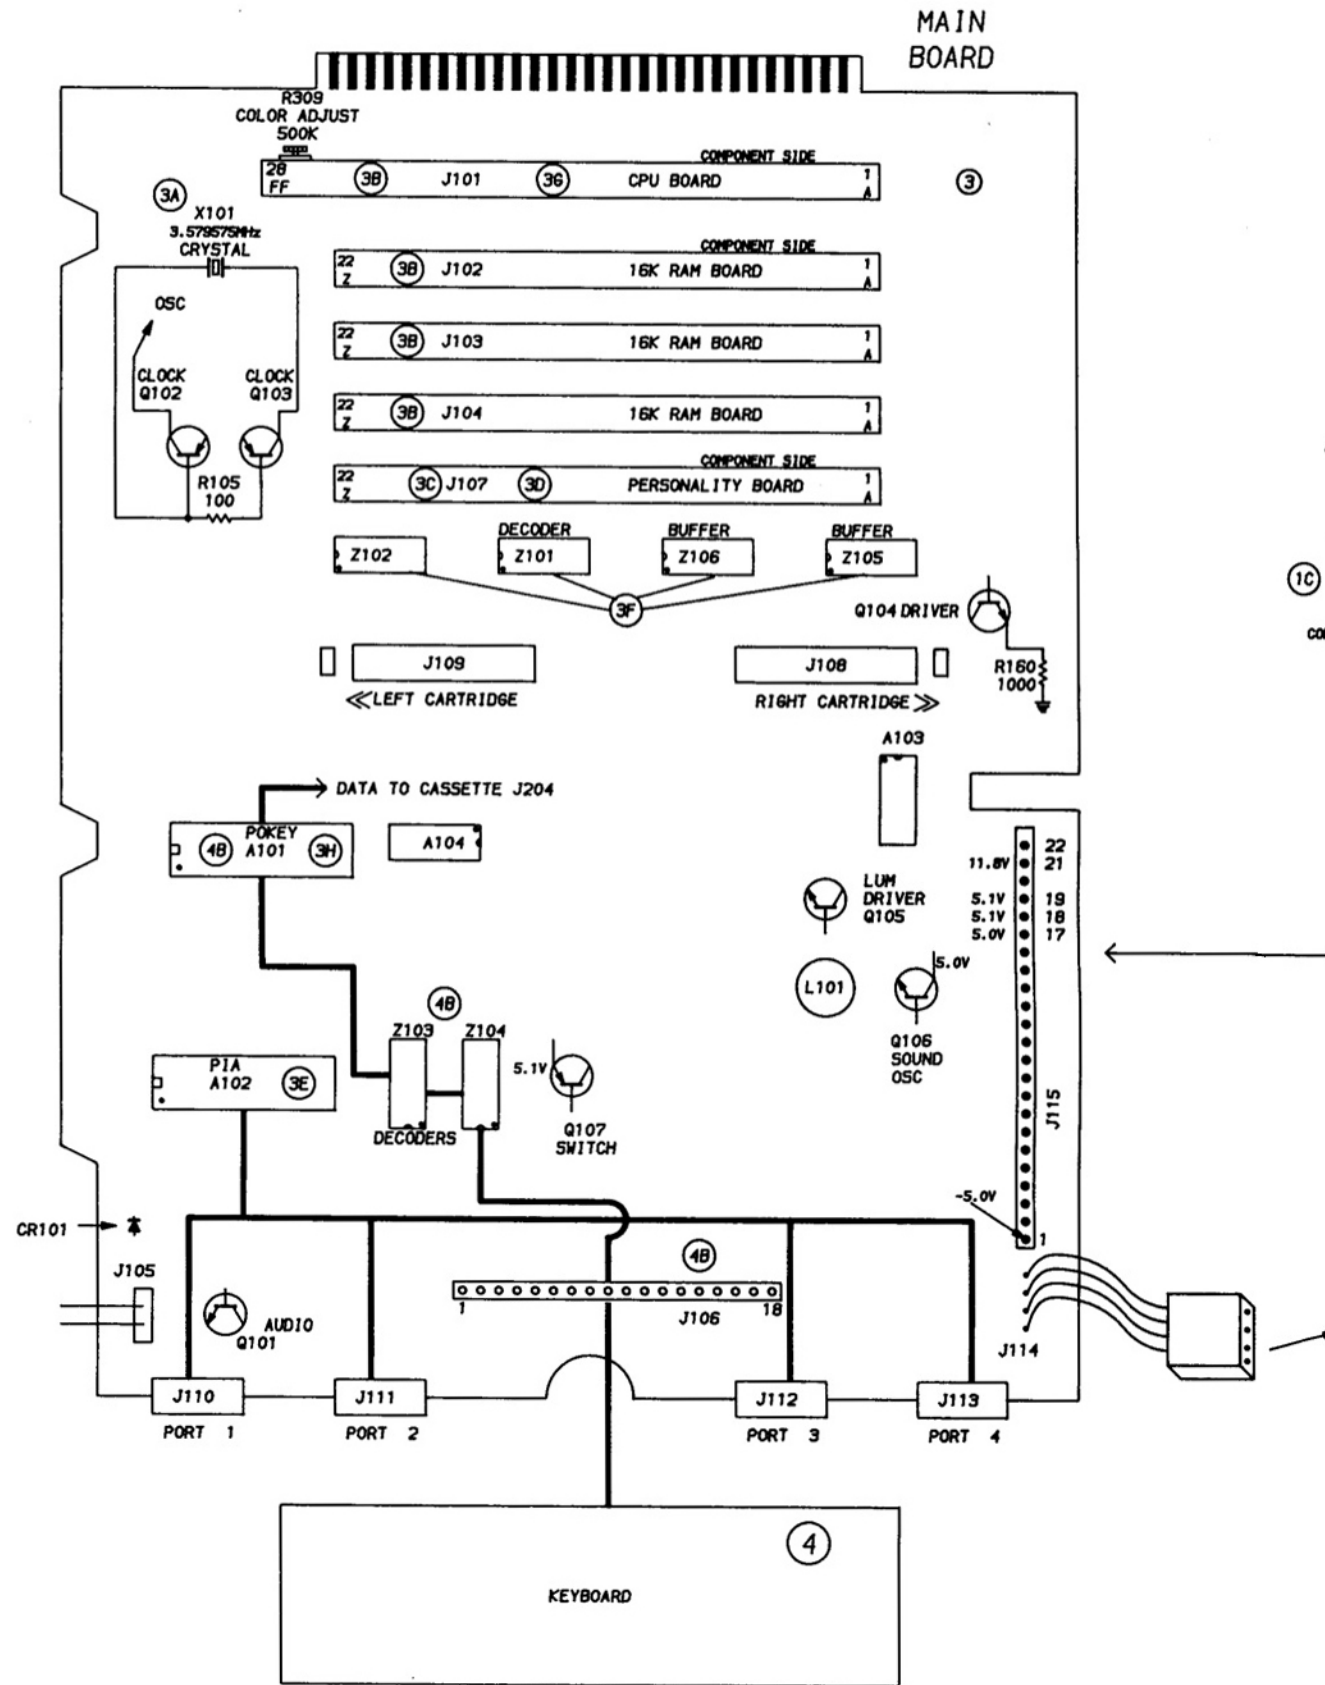

TEST EQUIPMENT

Digital Volt/Ohm Meter
Logic Probe
Frequency Counter

TOOLS

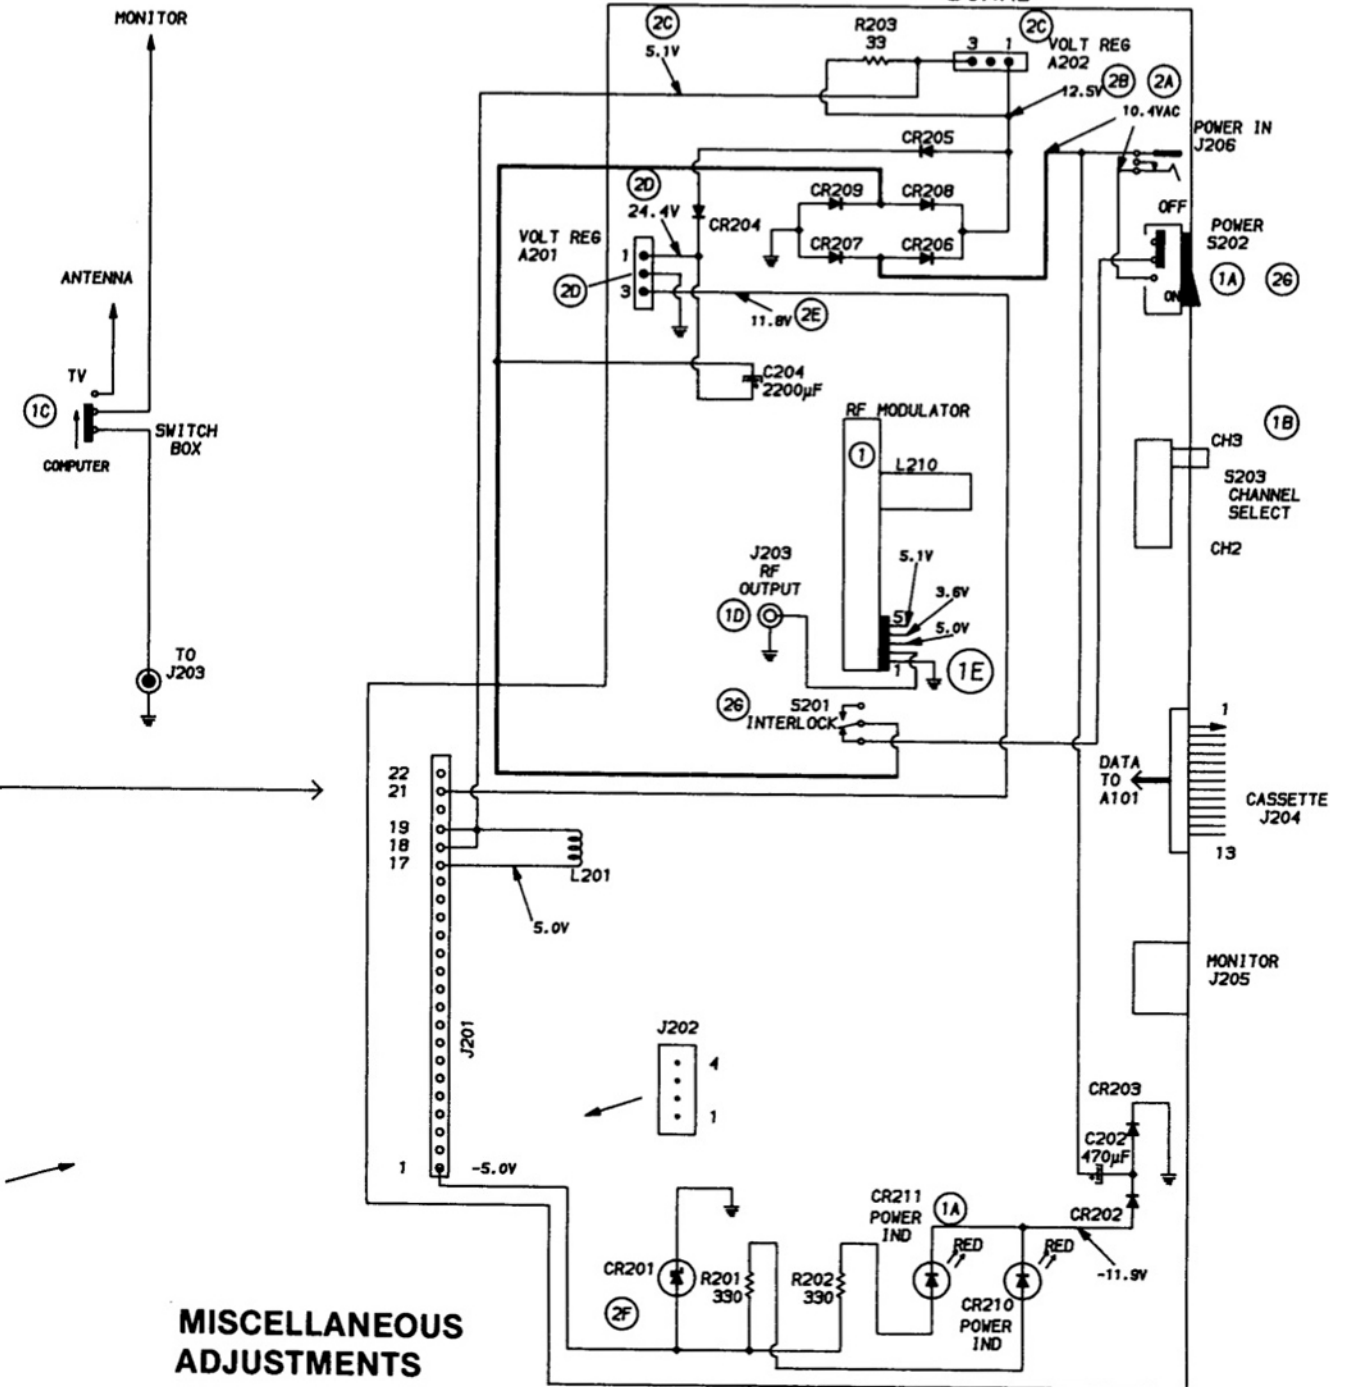

Phillips Screwdriver
Low-Voltage Soldering Iron
Alignment Tool - GC Electronics 9300, 9302, 9303

PRELIMINARY SERVICE CHECKS (Continued)

INTERCONNECTING DIAGRAM

PRELIMINARY SERVICE CHECKS (Continued)

MISCELLANEOUS ADJUSTMENTS

Suggested Alignment Tools:
L101, L210 9300, 9302, 9304

COLOR ADJUSTMENT

Turn On the computer and adjust the Color Adjust Control (R309) for a blue screen on the monitor.

SOUND ADJUSTMENT

Connect a pickup loop to the input of a Frequency Counter

GC Electronics
9300, 9302, 9304

and slip the loop over 4.5MHz Adjust Coil (L101). Adjust Coil L101 for a frequency of 4.5MHz.

RF MODULATOR ADJUSTMENT

Set TV on a channel 2 or 3 with the AFC Off. Set the Channel Select Switch (S203) to the same channel and adjust RF Modulator Adjust Coil (L210) for the best picture.

PRELIMINARY SERVICE CHECKS (Continued)

PREVENTATIVE MAINTENANCE

ENVIRONMENT

Computers perform best in a clean, cool area that is below 80 degrees Fahrenheit and free of dust and smoke particles. Even though home computers are not affected by cigarette smoke as much as commercial computers are affected, it is better to maintain a smoke-free area around the computer. Do not block cabinet vents of any of the computer system; computer, monitor, printer, or other power devices.

ELECTRICAL POWER

Variations in the line voltage can affect the computer. Try to avoid these fluctuations by using an AC receptacle that is on a power line not used by appliances or other heavy current demand devices. A power-surge protector, power-line conditioner, or non-interruptible power supply may be needed to cure the problem. **Do not** switch power On and Off frequently.

KEYBOARD

Liquids spilled into the keyboard can ruin it. Immediately after a spill occurs, disconnect the computer power plug from AC power outlet. Then, if circuitry or contacts are contaminated, disassemble the keyboard and carefully rinse the keyboard printed circuit board with distilled water and let it dry. Use a cotton swab to clean between the keys. Use a non-abrasive contact cleaner and lint-free wipers on accessible connectors and contacts.

DISK DRIVES

Clean the read/write heads of the disk drives about once a month or after 100 hours usage. Use only an approved head cleaning kit.

Handle carefully to preserve proper disk head alignment. A sudden bump or jolt to the disk drives can knock the disk head out of alignment. If the disk drive must be transported, place an old disk in slot during transport.

Store disks in their protective covers and never touch the disk surface. Observe the disk handling precautions usually found on the back of disk protective covers.

PRINTERS

Carefully vacuum the printer regularly. Wipe surface areas clean using a light all-purpose cleaner. Do not oil the machine. The oil will collect abrasive grit and dust. The dust will act as a blanket. This can cause components to overheat and fail.

STATIC ELECTRICITY

Static electricity discharge can affect the computer. In order to minimize the possibility, use anti-static mats, sprays, tools and materials, and maintain good humidity in the computer environment.

MONITOR

Use an isolation transformer with any monitor that does not come as part of the system since some monitors use a HOT chassis (chassis connected to one side of the AC line). The face of the monitor should never be left on for long periods of time at high brightness level except when pattern is being changed periodically. Use caution when cleaning anti-glare screens, to preserve the glare-reduction feature.

DISASSEMBLY INSTRUCTIONS

CABINET REMOVAL

Remove five screws holding cabinet bottom and remove the bottom. Open the cartridge door and remove two screws holding cartridge door assembly. Lift cartridge door assembly from cabinet top. Remove three black screws holding main board to cabinet top. Disconnect keyboard cable and speaker plug from main board and lift main board assembly from cabinet top.

KEYBOARD REMOVAL

Remove four black screws holding keyboard to cabinet top. Keyboard may now be removed from cabinet top.

SHIELD REMOVAL

Remove nine screws holding bottom shield to top shield. Disconnect connector J114 from power supply board at J202. Disconnect circuit board connector J115 from power supply board at J201 while removing bottom shield and main board from top shield. Remove three screws holding top shield to power supply board.

SAFETY PRECAUTIONS

1. Use an isolation transformer for servicing.
2. Maintain AC line voltage at rated input.
3. Remove AC power from the computer before servicing or installing electrostatically sensitive devices. Examples of typical ES devices are integrated circuits and semiconductor "chip" components.
4. Use extreme caution when handling the printed circuit boards. Some semiconductor devices can be damaged easily by static electricity. Drain off any electrostatic charge on your body by touching a known earth ground. Wear a commercially available discharging wrist strap device. This should be removed prior to applying power to the unit under test.
5. Use a grounded-tip, low voltage soldering iron.
6. Use an isolation (times 10) probe on scope.
7. Do not remove or install boards, floppy disk drives, printers, or other peripherals with computer AC power On.
8. Do not use freon-propelled sprays. These can generate electrical charges sufficient to damage semiconductor devices.
9. This computer is equipped with a grounded three-pronged AC plug. This plug must fit into a grounded AC power outlet. Do not defeat the AC plug safety feature.
10. Periodically examine the AC power cord for damaged or cracked insulation.
11. The computer cabinet is equipped with vents to prevent heat build-up. Never block, cover, or obstruct these vents.
12. Instructions should be given, especially to children, that objects should not be dropped or pushed into the vents of the cabinet. This could cause shock or equipment damage.
13. Never expose the computer to water. If exposed to water turn the unit Off. Do not place the computer near possible water sources.
14. Never leave the computer unattended or plugged into the AC outlet for long periods of time. Remove AC plug from AC outlet during lightning storms.
15. Do not allow anything to rest on AC power cord.
16. Unplug AC power cord from outlet before cleaning computer.
17. Never use liquids or aerosols directly on the computer. Spray on cloth and then apply to the computer cabinet. Make sure the computer is disconnected from the AC power line.

SCHEMATIC NOTES

- x— Circuitry not used in some versions
- Circuitry used in some versions
- See parts list
- ⊕ Ground
- ≡ Chassis
- ▽ Common tie point

Waveforms and voltages taken from ground, unless noted otherwise.

Voltages, Waveforms and Logic probe readings taken with a Basic cartridge plugged in, computer turned On, no keys pressed, unless otherwise noted.

Waveforms taken with triggered scope and Sweep/Time switch in Calibrate position, scope input set for DC coupling on 0 reference voltage waveforms. Switch to AC input to view waveforms after DC reference is measured when necessary. Each waveform is 7 cm. width with DC reference voltage given at the bottom line of each waveform.

Time in μ sec. per cm, given with p-p reading at the end of each waveform.

Item numbers in rectangles appear in the alignment/adjustment instructions.

Supply voltages maintained as shown at input. Voltages measured with digital meter, no signal. Controls adjusted for normal operation.

Terminal identification may not be found on unit.

Capacitors are 50 volts or less, 5% unless noted.

Electrolytic capacitors are 50 volts or less, 20% unless noted.

Resistors are $\frac{1}{2}$ W or less, 5% unless noted.

Value in () used in some versions.

Measurements with switching as shown, unless noted.

Logic Probe Display

- L = Low
- H = High
- P = Pulse
- * = Open (No light On)

- (1) Use the following chart to determine which keys produce pulses for the pin given.

Z104

PIN	KEYS
1	6, 7, Y, U, N

15	TAB, Q, W, E, R, T, Y

- (2) Probe indicates P with paddles connected to Port 4.
- (3) Probe indicates P with paddles connected to Port 3.
- (4) Probe indicates P with paddles connected to Port 2.
- (5) Probe indicates P with paddles connected to Port 1.
- (6) Probe indicates L when paddle trigger is pressed. Use the following chart to determine which pin is affected by each paddle trigger.

PADDLE TRIGGER	A102 PIN
0	4
1	5
2	8
3	9
4	12
5	13
6	16
7	17

- (7) Probe indicates L when joystick is used. Use the following chart to determine which pin is affected by each joystick function.

	PORT 1	PORT 2	PORT 3	PORT 4
JOYSTICK	IC	PIN	IC	PIN
UP	A102	2	A102	6
DOWN	A102	3	A102	7
LEFT	A102	4	A102	8
RIGHT	A102	5	A102	9
BUTTON	A301	8	A301	9

- (8) Probe indicates P while loading a program from tape.
- (9) Probe indicates P while saving a program on tape.
- (10) Probe indicates L while saving or loading a program from tape recorder.
- (11) Probe indicates P when the internal speaker is being used.
- (12) Probe indicates P when any key except BREAK, CTRL or SHIFT is pressed.
- (13) Probe indicates P when BREAK, CTRL or SHIFT key is pressed.
- (14) Probe indicates one pulse when any key except SHIFT or CTRL is pressed.
- (15) Probe indicates L when START key is pressed.
- (16) Probe indicates L when SELECT key is pressed.
- (17) Probe indicates L when OPTION key is pressed.
- (18) Probe indicates L when SYSTEM RESET key is pressed.
- (19) Logic probe readings not taken.
- (20) Voltages and logic probe readings not taken for Alternate CPU Board.

CC7 ATARI MODEL 800

GENERAL OPERATING INSTRUCTIONS

POWER UP

The computer will come up ready to program in Basic when a Basic cartridge is plugged in and the computer is turned On.

For instructions on loading and saving programs with an Atari Recorder see the "Cassette Operation" section.

To run a program type RUN and press the RETURN key. To stop a program, press the BREAK key or press the system RESET key.

CASSETTE OPERATION

Connect the Atari Program Recorder to the connector on the right side of the computer. NOTE: A standard tape recorder will not work with this computer.

To load a program, type CLOAD and press the RETURN key. The speaker will beep once. After the speaker beeps, push the play button on the recorder and press the RETURN key again. The program will then load. READY on the screen indicates the loading is completed. The recorder will shut-off automatically.

To save a program, type CSAVE and press the RETURN key. The speaker will beep twice and after the speaker beeps, press the play and record buttons on the recorder and then press the RETURN key. The program will then save. READY on the screen indicates the program has been saved. The recorder will shut-off automatically.

DISASSEMBLY INSTRUCTIONS

CABINET REMOVAL

Remove five screws holding cabinet bottom and remove the bottom. Open the cartridge door and remove two screws holding cartridge door assembly. Lift cartridge door assembly from cabinet top. Remove three black screws holding main board to cabinet top. Disconnect keyboard cable and speaker plug from main board and lift main board assembly from cabinet top.

KEYBOARD REMOVAL

Remove four black screws holding keyboard to cabinet top. Keyboard may now be removed from cabinet top.

SHIELD REMOVAL

Remove nine screws holding bottom shield to top shield. Disconnect connector J114 from power supply board at J202. Disconnect circuit board connector J115 from power supply board at J201 while removing bottom shield and main board from top shield. Remove three screws holding top shield to power supply board.

MISCELLANEOUS ADJUSTMENTS

Suggested Alignment Tools: GC Electronics
L101, L210 9300, 9302, 9304

COLOR ADJUSTMENT

Turn On the computer and adjust the Color Adjust Control (R309) for a blue screen on the monitor.

SOUND ADJUSTMENT

Connect a pickup loop to the input of a Frequency Counter

and slip the loop over 4.5MHz Adjust Coil (L101). Adjust Coil L101 for a frequency of 4.5MHz.

RF MODULATOR ADJUSTMENT

Set TV on a channel 2 or 3 with the AFC Off. Set the Channel Select Switch (S203) to the same channel and adjust RF Modulator Adjust Coil (L210) for the best picture.

TROUBLESHOOTING

POWER SUPPLY

Check for 10.4VAC from the cathode of Diode CR207 to the cathode of Diode CR209. If 10.4VAC is missing, check Interlock Switch (S201), Power Switch (S202), Jack J206 and the Power Pack.

Check for 12.5V at pin 1 of Voltage Regulator IC (A202). If 12.5V is missing, check Diodes CR206 thru CR209, Electrolytics C207 and C208 and check for possible shorts to ground. Check for 5.1V at pin 3 of IC A202. If 5.1V is missing, check for possible shorts to ground and check IC A202 by substitution.

Check for 24.4V at pin 1 of Voltage Regulator IC (A201). If 24.4V is missing, check Diodes CR204 and CR205, Capacitors C203 and C212, Electrolytics C204 and C205, and check for possible shorts to ground.

Check for 11.8V at pin 3 of IC A201. If 11.8V is missing, check for possible shorts to ground and check IC A201 by substitution.

Check for -11.9V at the anode of Diode CR202. If -11.9V is missing, check Diodes CR202 and CR203, Electrolytics C201 and C202 and check for possible shorts to ground.

Check for -5.0V at the anode of Zener Diode CR201. If -5.0V is missing, check Zener Diode CR201, Power Indicator LEDs (CR210 and CR211), Resistor R201 and R202 and check for possible shorts to ground.

CPU OPERATION

Verify the CPU IC (A303) is functioning by using a logic probe to check for pulses on pins 9 thru 20 and 22 thru 33 of IC A303. If IC A303 is not functioning, check for 5.1V at pin 8 of IC A303. If 5.1V is missing, refer to the "Power Supply" section of this Troubleshooting guide.

Check the waveform at pin 37 of IC A303. If the waveform is missing, check the waveform at the collector of the Clock Transistor (Q102). If the waveform at the collector of Transistor Q102 is missing, check the voltages and components associated with Clock Transistors (Q102 and Q103). If the waveform at the collector of Transistor Q102 is good, check the waveform at pin 30 of the CTIA IC (A301). If the waveform is missing, check IC A301 by substitution.

If waveform at pin 37 of IC A303 is correct, check the logic probe readings on pins 2, 3, 4, 6, 7, 34, 38, 39 and 40 of IC A303.

VIDEO

No video. Check for a video waveform at pin 20 of Jack J201. If the waveform is correct, check the RF Modulator (A204). If the waveform is missing, check the waveforms and voltages on pins 9 thru 12, 14 and 15 of IC A103. If any of the waveforms are missing, check IC A103 by substitution. Check voltages, waveforms and logic probe readings on pins 1 thru 40 of the CTIA IC (A301) and if any are in error, check IC A301 by substitution.

SYNC

No vertical or horizontal sync. Check the waveform at pin 25 of the CTIA IC (A301). If the waveform is missing, check IC A301 by substitution. If the waveform is correct, check voltages and waveforms associated with pins 6 and 7 of IC A103.

KEYBOARD

Computer comes up with the proper display on the monitor screen but the keyboard does not function. Check the waveforms on pins 18 thru 23 of the POKEY IC (A101). If the waveforms are missing, check IC A101 by substitution.

If the waveforms are correct, check the waveforms on pins 16 and 25 of IC A101. The waveform on pin 16 of IC A101 appears when the BREAK, CTRL or SHIFT keys are pressed. The waveform on pin 25 appears when any key except BREAK, CTRL, SHIFT, SYSTEM, RESET, OPTION, SELECT or START key is pressed. Check for a pulse on pin 29 of IC A101 with a logic probe while any key is pressed.

If the waveforms on pins 16 or 25 of IC A101 are missing, check the voltages and logic probe readings on pins 1 thru 16 of Decoder ICs (Z103 and Z104). If the readings are not correct, check the ICs A101, Z103 and Z104 by substitution.

If the readings are correct, check the keyboard connector J106 and check the keyboard switch contacts. If a pulse does not appear on pin 29 of IC A101 when a key is pressed, check IC A101 by substitution.

The START, SELECT, OPTION or SYSTEM RESET keys do not function. Check the logic probe readings on pins 12, 13 and 14 of the CTIA IC (A301) and pin 6 of the ANTIC IC (A302) while the malfunctioning key is pressed. If any of the logic readings stay high when the key is pressed, check the connectors at J114 and J202 for proper connection. If the logic readings are correct, check ICs A301 and A302 by substitution.

If there is no sound from the internal speaker when a key is pressed, refer to the "Audio" section of this Troubleshooting guide.

COLOR OSCILLATOR

Check for 3.57957MHz at the collector of Clock Transistor (Q102). If the frequency is incorrect, check the Oscillator Crystal (X101) by substitution.

COLOR

No color, check the waveform at pin 21 of the CTIA IC (A301). If the waveform is missing, check the adjustment of the Color Adjust Control (R309). The voltage at pin 17 of IC A301 should vary from about 0V to 7V as Control R309 is adjusted from Maximum to MINIMUM. If the voltage does not change, check Control R309, Capacitor C305, Resistor R308, the 11.8V source and check IC A301 by substitution.

If there is no problem with Control R309, check the waveform at pin 28 of IC A301. If the waveform is missing, check the logic probe readings on pins 1 thru 40 of the ANTIC IC (A302) and if incorrect, check IC A302 by substitution.

If the waveform at pin 21 of IC A301 is correct, check the voltages, waveforms and components associated with pins 12, 14 and 10 of IC A104. Check the waveform at pin 3 of Connector J201 on the power supply board.

If the colors are incorrect, check the adjustment of Control R309 and check the frequency of 3.57957MHz oscillator at pin 28 of IC A301. If the oscillator is off frequency see "Color Oscillator" section of this Troubleshooting guide.

TROUBLESHOOTING (Continued)

AUDIO

No sound from the internal speaker when a key is pressed. Check the speaker (SP101). If the speaker is good, type and run the following Basic program:

```
10 PRINT CHR$(253): GOTO 10
```

Check for 1.4V p-p pulses at pin 15 of CTIA IC (A301). If the pulses are missing, check IC A301 by substitution. If the pulses are present, check for .5V p-p pulses at the base of Audio Transistor (Q101). If the pulses are missing, check Resistor R102 and Transistor Q101. If the pulses are normal, check Transistor Q101, Diode CR101, Resistor R101 and the 5.1V source.

If the computer does not produce sound from the monitor, type and run the following Basic program:

```
10 SOUND 0, 100, 10, 15: GOTO 10
```

Check for waveform at pin 37 of the POKEY IC (A101), see Figure 1. If the waveform is missing, check IC A101 by substitution. If the waveform is correct, check the frequency of the Sound Oscillator Transistor (Q106) by connecting a pickup loop to the input of a Frequency Counter and slip the loop over 4.5MHz Adjust Coil (L101). The frequency should be 4.5MHz. If transistor Q106 is not functioning properly, check the voltages and components associated with Transistor Q106.

If external audio output is not working, check the connections at pin 2 of Jack J201 and check the voltages and components associated with IC A104.

CASSETTE SAVE AND LOAD

Computer will not save a program on tape. Type a program or load an existing program into the computer. Save the program back on tape, see "Cassette Operation" section of the General Operating Instructions. While saving the program, check the waveforms on pins 26, 27 and 28 of the POKEY IC (A101). If any of the waveforms are missing, check IC A101 by substitution. If the waveforms are correct, check the connections at pins 8, 7 and 10 of Jack J201 and pins 1, 2 and 5 of Jack J204.

Computer will not load a program from tape. Check for pulses at pin 24 of IC A101 while loading a program from tape, see "Cassette Operation" section of the General Operating Instructions. If the pulses are correct, check the connections at pin 9 of Jack J201 and pin 3 of Jack J204.

Recorder motor will not start when saving or loading a program. Type POKE 54018,52 and press the RETURN key. Check the logic probe reading on pin 39 of the PIA IC (A102). The reading should go from high to low to start the recorder motor. If the reading stays high, check IC A102 by substitution. If the reading operates normally, check Switch Transistor (Q107) and check the connections at pin 4 of Jack J201 and pin 8 of Jack J204. To turn the recorder motor Off, type POKE 54018,60 and press RETURN key.

JOYSTICKS

Joysticks do not function. Check the logic probe readings on the PIA IC (A102) and the CTIA IC (A301). If reading does not go low when its joystick function is used, check the connector contacts on the port being used and check the joystick switches. If the readings are correct, check IC's A102 and A301 by substitution.

The following Basic program can be used to check the operation of the joystick ports. Plug a joystick into the port being tested, type in and run the program.

```
10 PRINT, "JOYSTICK", "BUTTON"  
20 FOR P = 0 TO 3  
30 PRINT "PORT"; P, STICK (P), STRIG (P)  
40 NEXT P  
50 FOR T = 1 TO 200: NEXT T  
60 GOTO 10
```

On the monitor screen the number 1 under BUTTON should change to 0 when the button is pressed. The number 15 under JOYSTICK should change to the following for each position of the joystick:

UP 14	LEFT 11
DOWN 13	RIGHT 7

TROUBLESHOOTING (Continued)

PADDLES

If a paddle does not function, use the following chart to determine which pin of the POKEY IC (A101) the paddle is connected to and check the waveform on the pin.

PORT	PADDLE	A101 PIN	BUTTON	A102 PIN
1	0	14	0	4
1	1	15	1	5
2	2	12	2	8
2	3	13	3	9
3	4	10	4	12
3	5	11	5	13
4	6	8	6	16
4	7	9	7	17

the button is connected to and use a logic probe to check the pin while the button is pressed. The logic probe reading should go from high to low when the button is pressed. If the reading does not go low, check the button switch and the port connector. If the logic reading is correct, check the PIA IC (A102) by substitution.

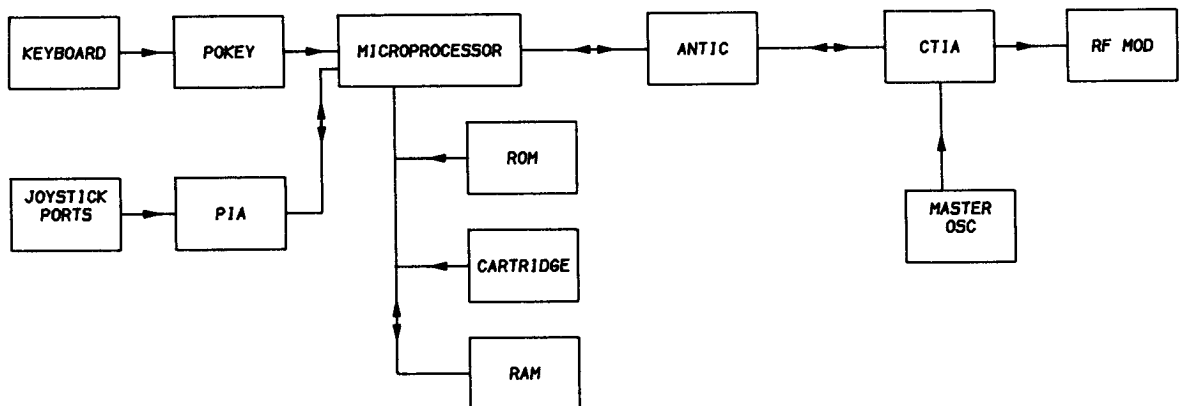

The following Basic program can be used to check the operation of the paddles.

```

10 PRINT, "PADDLE", "BUTTON"
20 FOR P=0 TO 7
30 PRINT "PADDLE"; P, PADDLE (P), PTRIG (P)
40 NEXT P
50 FOR T=1 TO 200: NEXT T
60 GOTO 10
    
```

On the monitor screen the number under PADDLE should vary from 228 to 1 as the paddle is varied from MINIMUM to Maximum. The number 1 under BUTTON should change to 0 when the button is pressed.

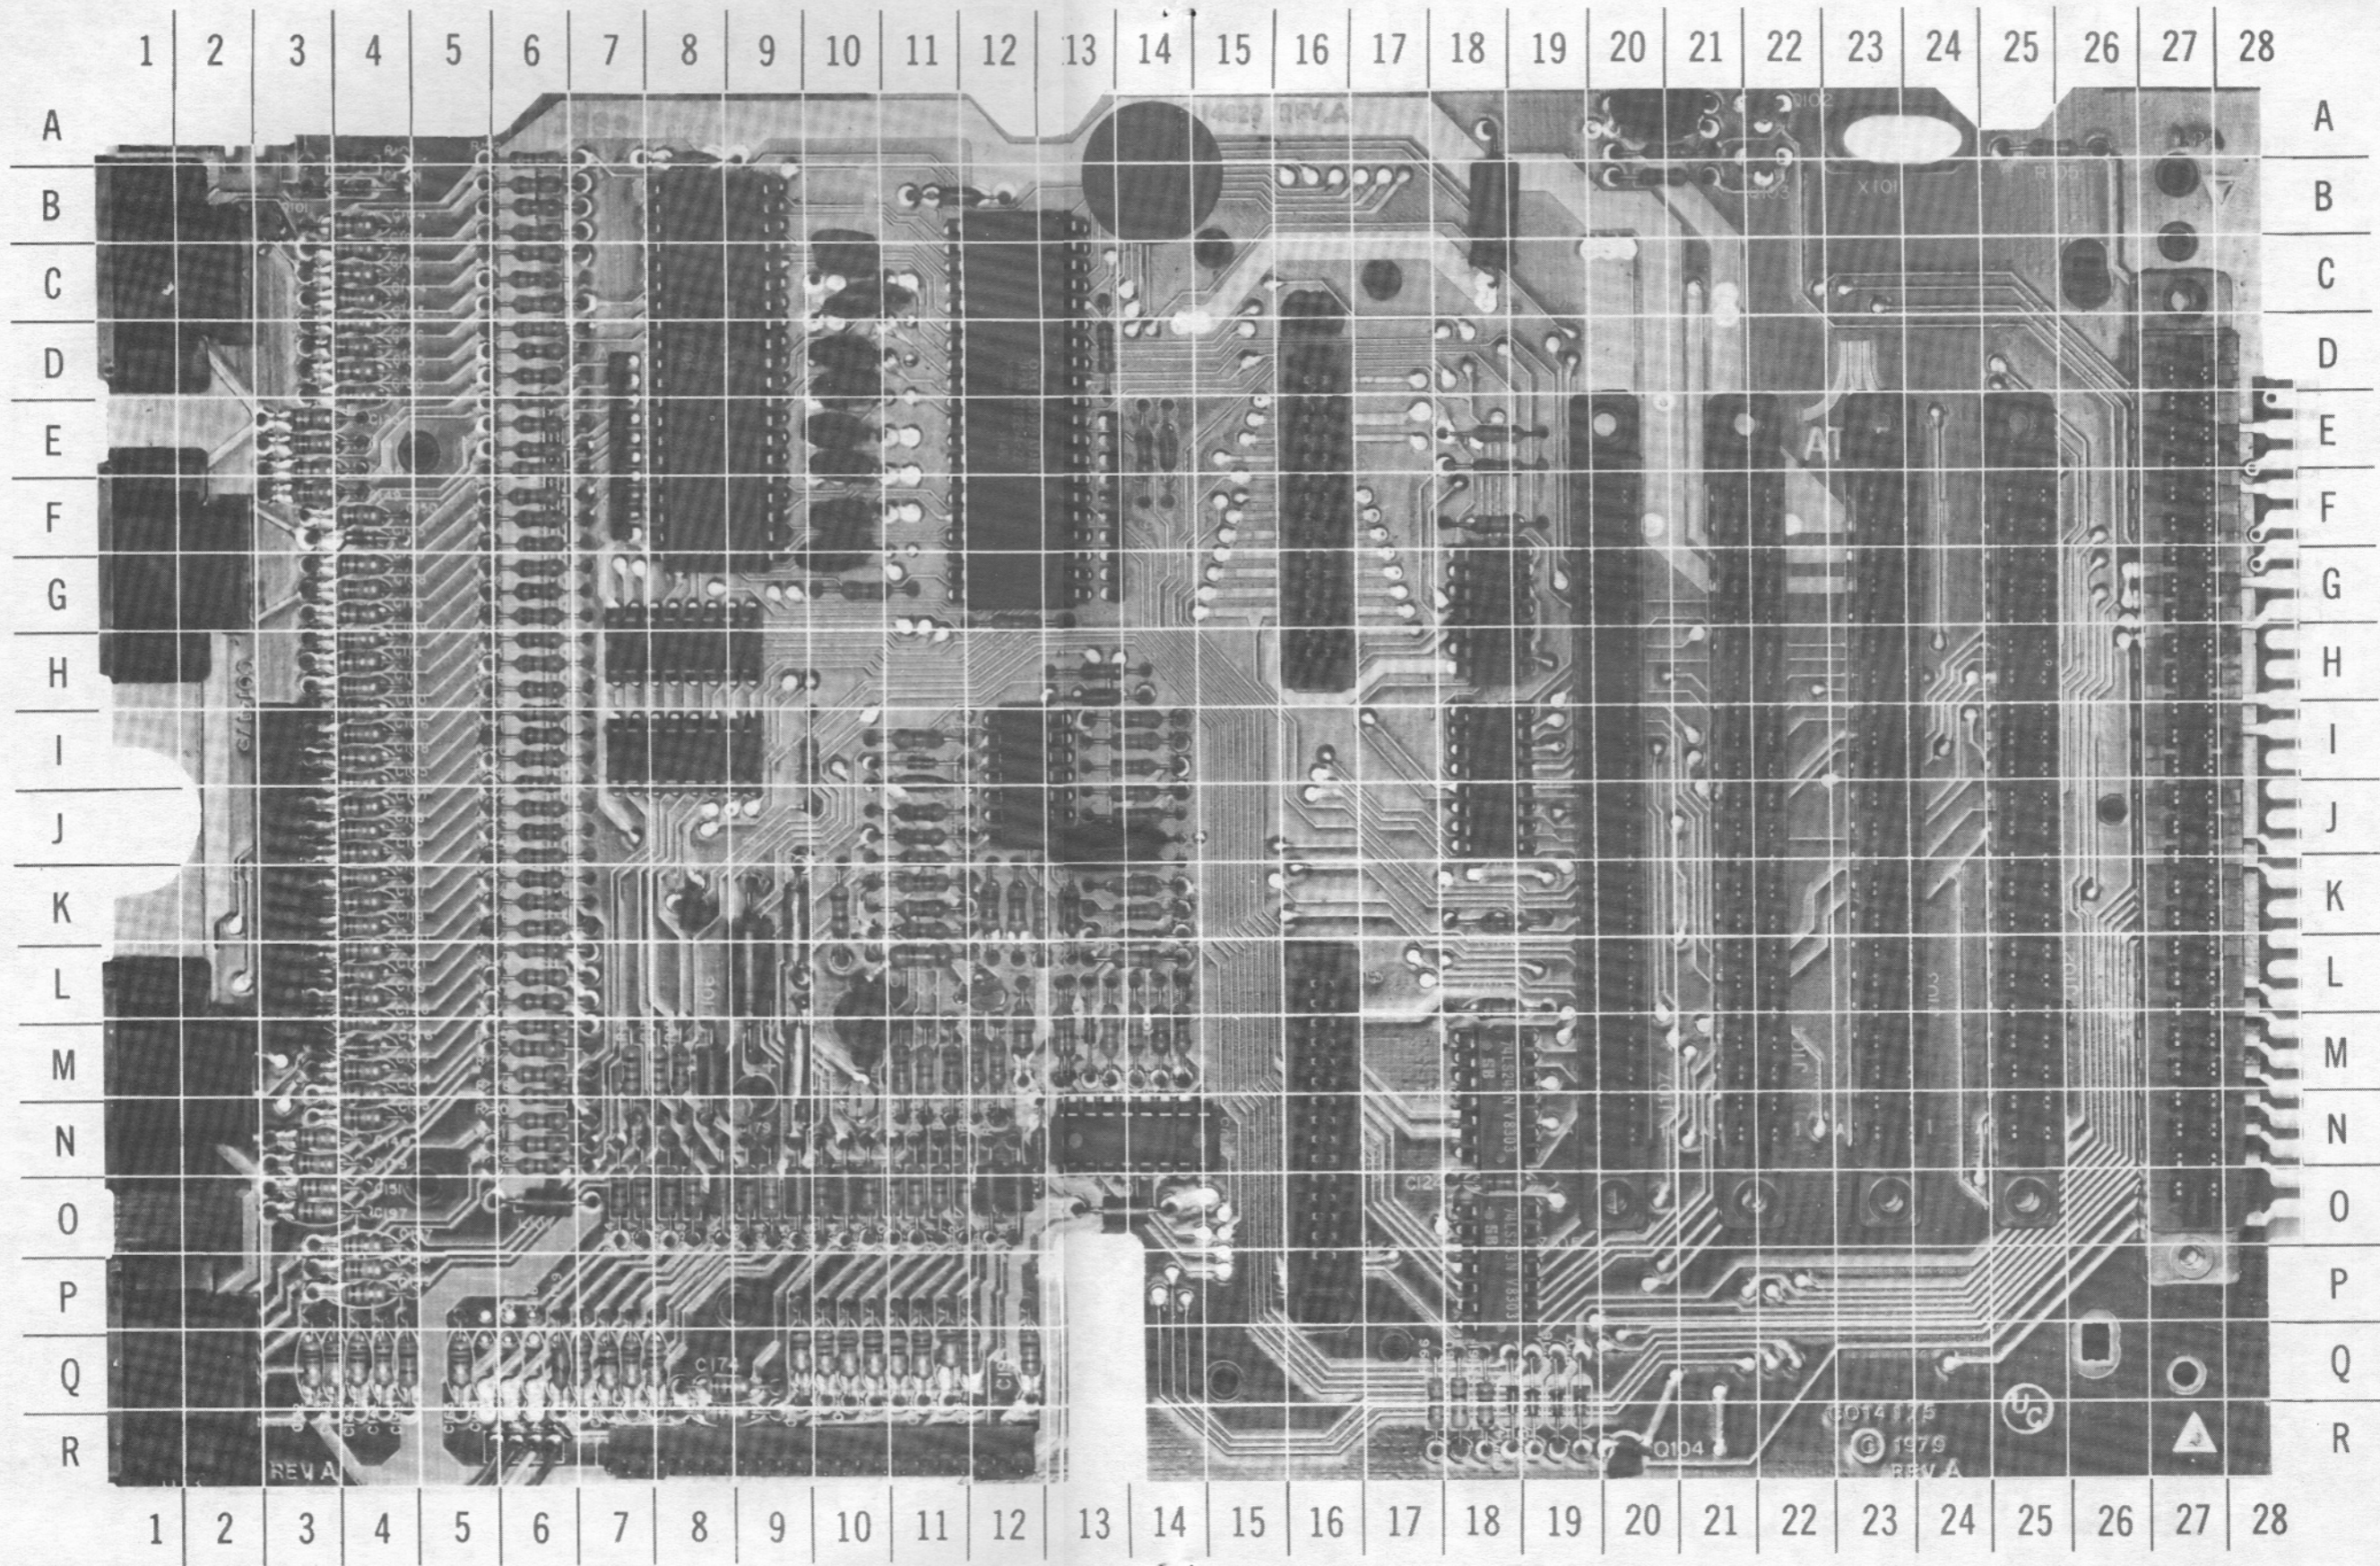

The waveform should vary from the sawtooth waveform shown in Figure 2 to the pulse waveform shown in Figure 3. If the waveform is missing, check the port connector, the paddle control and check IC A101 by substitution. If a button is not functioning, use the chart to determine which pin

Remove staples and use cover for file folder.

COMPUTERFACTS™ put easy to use, informative technical data right at your fingertips. Each edition includes specific service information on the individual component, along with some overall troubleshooting hints.

- The following information is just a sample of the many valuable time saving features contained in this exclusive Sams COMPUTERFACTS publication:
- Preliminary Service Checks section is an easy to use, step by step guide for the experienced technician or hobbyist, and even beginners.
- SAMS famous industry accepted standardized notation schematics containing CIRCUITRACE®, GRIDTRACE™, waveforms, voltages and stage identification.

- Step by Step Troubleshooting guides the technician through the necessary procedures to quickly locate the problem.

TROUBLESHOOTING

MICROPROCESSOR CHIP (CPU) OPERATION

Verify the processor is functioning by checking the signals on lines 41 thru 46 using a logic probe or a scope. If a logic probe is used, refer to the "Logic Chart" for the correct readings. If a scope is used, the waveforms on the address lines (except pins 22 and 23 which have no signal in PowerUp mode) should be similar to Figure 2.

- Logic Chart containing logic probe readings to isolate defective circuitry and components.
